

You are rebuilding and improving an existing product called Quotex Insurance. Treat this as a mission-critical commercial SaaS product, not a toy demo.

Quotex Insurance is a luxury, professional, AI-powered insurance agency operating system for private-client and high-touch insurance agencies. The product currently includes a public website, build-my-plan checkout, system/master portal, employee agency portal, customer portal, customer mobile app experience, AI quote flows, documents, messages, billing, claims, renewals, marketing, analytics, accounting, HR, training, carrier library, and agency setup.

Your job is to recreate this product perfectly, preserve every intended workflow, improve anything weak, and make it more stable, professional, scalable, and production-ready than the current version.

MOST IMPORTANT RULES:

Do not create a shallow mockup. Do not remove important functionality. Do not fake completed production integrations. Do not let the app get stuck on loading screens. Do not allow non-working buttons. Do not create UI that overlaps, cuts off, scrolls awkwardly, or breaks on laptop vs monitor. Every visible button must either work or clearly be disabled with a reason. Every page must load reliably.

DESIGN DIRECTION:

The product should feel luxury, technical, clean, and serious. Use a black, white, warm neutral, and soft gold visual system. The design should feel like high-end financial/legal/insurance software, not a generic SaaS template. Typography must be crisp. Buttons must be consistent. Cards, tables, filters, badges, forms, modals, timelines, and sidebars must follow one design system. No decorative clutter. No random gradients. No childish AI visuals. The user should immediately feel: "This is expensive, trusted, and powerful."

ARCHITECTURE REQUIREMENTS:

Use a real production-ready architecture with demo mode still available. Recommended stack: React/TypeScript frontend, Supabase backend, Postgres, row-level security, Supabase Auth or equivalent, object storage for files, secure credential vault for carrier/email runners, audit logs, transactional email provider, and Stripe or equivalent billing. Demo mode may use seeded local data, but production paths must be designed properly.

CRITICAL RELIABILITY REQUIREMENT:

The app shell must never trap users on a loading screen. Avoid fragile top-level lazy-loaded routing that can leave users stuck. Add error boundaries, timeout recovery screens, and clear retry buttons. All main paths must load directly:

/

- /checkout
- /employee
- /employee/tasks
- /employee/clients

/employee/clients/customer_demo
/employee/messages
/employee/documents
/employee/policies
/master
/master/agencies
/customer

PUBLIC WEBSITE:

Create a Quotex Insurance homepage with strong branding, contact page, login button, build-my-plan button, and view-demo lead capture. Public demos should not be freely exposed before lead capture. "View demo" should collect name, email, agency name, role, staff size, phone, and what they want to see. After submission, they can select software demo, agency website demo, app demo, or build monthly plan. Master portal must collect those leads. Public screenshots/photo galleries must use real product screenshots, not fake illustrations.

BUILD MY PLAN / CHECKOUT:

Users enter agency name, billing contact, billing email, phone, optional website, and optional notes. Website and notes are not required. Then they choose number of users. Pricing is \$300/user/month. Add-ons: company website \$3,000/mo, Quotex app \$3,000/mo, website + app bundle \$5,000/mo with "Bundle saves you \$1,000 per month" displayed clearly. Add term selector: 12 months, 24 months with 5% discount, 36 months with 8% discount. State they can renew at any time. Final plan is shown only after Create Plan. Payment is a separate page. E-sign required documents must be individually viewed and signed before payment. After successful payment, show "Successful, welcome to Quotex." After failure, show "Payment failed, try a different payment method." After payment, send formal invoice and encrypted agency code to billing email. Master portal must allow manual special pricing per agency.

MASTER / SYSTEM PORTAL:

Rename Master Portal label to System. Include agencies, agency detail, billing, renewals, leads, e-signed documents, carrier library, insurance categories, training videos, users, activities, analytics, data tools, settings, and Build A Plan. Add agency renewals showing each agency, term length, months remaining, renewal date, and send renewal contract. Add master activity log showing every agency change, addition, deletion, pricing update, user update, renewal, billing change, and timestamp. Billing must show MRR, add-ons, manual overrides, total revenue, and per-agency pricing. No "mark paid" button if payments are automatic.

AGENCY ROLES:

Support manager, agent, and CSR. CSR has same operational abilities as agent but different label. Remove producer/general user unless explicitly requested later. Managers see routing, agency setup, user management, pricing/plan info, accounting, HR submissions, analytics, and performance. Agents/CSRs see their assigned work and read-only agency setup except their own account settings.

EMPLOYEE PORTAL MODULES:

Dashboard, Activity Center, Calendar, Messages, Prospects, Clients, Policies, Claims, Billing, Renewals, Document Review, AI Marketing, Carrier Library, Analytics, Accounting, HR, Archive, Training Videos, Agency Setup, Account Settings. Sidebar must fit without cutting off categories and should remain stable. Account Settings replaces sign-out area at bottom.

ACTIVITY CENTER:

Separate activities from quote flows. Rename workflows to Quote Flows. Layout order: open activities, quote flows, resolved. Resolved means closed activities and completed quote flows. Create New Activity belongs top right of open activities. Create New Quote Flow belongs in quote flows. Managers still have routing. AI auto-routes personal/commercial prospects and clients evenly among eligible staff. Reroute requests appear inside prospect/client routing boxes, not a separate box. Closing an activity requires a resolution note. The note logs to client remarks and activity timeline.

CLIENT / PROSPECT RECORDS:

Each client/prospect has profile, assigned agent, assigned CSR, policies, billing, claims, documents, messages, remarks, activity timeline, marketing campaigns received, and AI quote workspace. Commercial clients show business name above individual contact name. Profile fields must be locked unless Edit Profile is clicked. Assigned agent/CSR cannot be edited while locked. Client timeline and remarks must include everything from prospect creation onward: routing, assignments, quote flows, messages, document uploads, document renewals, policy sends, billing changes, claims, marketing campaigns, activity closures, carrier updates, and notes.

POLICIES:

Rows must be consistent with clients, prospects, claims, billing, and renewals. Policy rows are labeled by policy number first; asset is secondary. Policy detail page includes combined policy overview/coverage card, documents card, holders/contacts card, participants card, billing link, claims link, and timeline. Policy holders/contacts are document recipients: named insureds, additional insureds, lienholders, mortgagees, certificate holders. Policy participants are underwriting/rating participants: drivers, operators, household members, occupants, excluded drivers, etc. They are not document recipients unless also added as contacts. Add "contacts on file" quick-add for both.

DOCUMENTS:

Agency document library is template-only, not filled client history. Templates include document type, line applicability, required/not required, e-sign required from customer/agent/both, locked edit/save configuration per row. Upload should detect fillable fields and preserve the original document while overlaying editable text boxes sized to the fields. Client/policy documents show current term only. Previous term documents sit in a collapsed bar. Documents must show descriptive status labels such as uploaded, edited, renewed, updated, published, with exact date. Update for renewal creates a review draft, not a published document. Publish moves renewed documents correctly.

QUOTE FLOWS:

QUOTE FLOWS — FULL A-Z SPEC

Rebuild the Quotex “Quote Flows” system as the central workflow engine for quoting insurance. Quote Flows are not ordinary activities. They are live, trackable quoting workspaces that guide an agency from initial quote intake through carrier submission, carrier responses, supplemental requests, quote ranking, client presentation, and final policy implementation/placement tracking.

Use the name “Quote Flows” everywhere. Do not call them workflows.

CORE PURPOSE

A Quote Flow exists whenever a client, prospect, agent, CSR, or manager starts a quote process. It tracks the entire quote lifecycle from beginning to end and connects to the client/prospect profile, activity timeline, remarks, messages, documents, carrier library, calendar/reminders, and policy/billing records.

Quote Flows must support both:

1. Personal lines
2. Commercial lines

They must behave differently because personal and commercial quoting are fundamentally different.

GENERAL QUOTE FLOW STATES

Every quote flow should have a clear status pipeline:

- Draft
- Intake started
- Public data enrichment
- Missing information identified
- Questionnaire sent
- Questionnaire in progress
- Questionnaire completed
- Application prepared
- Carrier selection
- Email draft review
- Sent to carriers
- Awaiting carrier response
- Supplemental requested
- Supplemental questionnaire sent
- Supplemental completed
- Supplemental package prepared
- Supplemental email draft review

- Supplemental sent to carrier
- Carrier accepted
- Carrier declined
- Ranking visible
- Presented to client
- Bound / implemented manually on carrier
- Added to policies
- Added to billing
- Completed
- Cancelled / abandoned

Not every quote flow needs every state. The system should show only the relevant steps for the selected quote type.

ACTIVITY CENTER PLACEMENT

Quote Flows must appear in the Activity Center in their own section underneath open activities.

Layout order:

1. Open Activities
2. Quote Flows
3. Resolved

The Quote Flows card should show:

- Total in session
- Incomplete customer quotes
- Ranking visible
- Rows for each active quote flow
- Client/prospect name
- Personal or commercial line
- Asset or policy type
- Owner/assigned staff
- Current stage
- Last update time
- Progress indicator
- Open button
- Create New Quote Flow button top right

Quote Flows should not be mixed into ordinary activities, but quote-flow events may create related activities when staff action is required.

CLIENT / PROSPECT CONNECTION

Every quote flow must be attached to either:

- Existing client
- Existing prospect

- New prospect created from quote intake
- New client created by staff

The quote flow must appear on that person's dashboard and timeline.

The client/prospect activity timeline and remarks should log every major quote-flow step:

- Quote flow started
- Intake completed
- AI/public data enrichment completed
- Questionnaire generated
- Questionnaire sent
- Questionnaire completed
- Carrier application prepared
- Sent to carriers
- Carrier response received
- Supplemental requested
- Supplemental sent
- Ranking generated
- Quote presented
- Policy added
- Quote flow completed
- Quote flow cancelled

The wording should sound natural. Do not expose internal automation language like "AI runner did this." Say things like:

- "Commercial application prepared for carrier review."
- "Supplemental information requested by Chubb."
- "Carrier response received from PURE."
- "Quote options ranked for review."

PERSONAL LINES FLOW

Step 1: Start Quote Flow

A user can start a personal quote flow from:

- Client dashboard
- Prospect dashboard
- Activity Center
- Customer portal quote intake
- App quote intake
- Public agency website quote intake

The first required field is line type:

- Personal lines
- Commercial lines

If Personal lines is selected, the system asks what the person wants to insure.

Personal lines categories should include, at minimum:

- Home
- Condo
- Renters
- Auto
- Collector auto
- Motorcycle
- RV
- Boat
- Yacht
- Personal umbrella
- Jewelry
- Fine art
- Collectibles
- Flood
- Wind
- Excess liability
- Secondary home
- Rental dwelling
- High-value home
- Pet, if supported
- Other personal line

Step 2: Asset-Specific Intake

Personal lines must ask different questions depending on the asset.

For home/property:

- Property address
- Occupancy
- Year built
- Square footage
- Construction type
- Roof type
- Roof year
- Updates to plumbing/electrical/HVAC
- Protection class
- Distance to coast/fire hydrant/fire station if available
- Flood zone
- Prior claims
- Current carrier
- Current premium

- Desired effective date
- Mortgagee/lienholder if applicable
- Existing inspections/docs

For auto:

- Vehicle year/make/model/VIN
- Garaging address
- Drivers
- Driver DOB
- License state/number
- Usage
- Annual mileage
- Prior claims/violations
- Current carrier
- Current premium
- Desired effective date
- Lienholder if applicable

For jewelry/fine art/collectibles:

- Item type
- Value
- Appraisal date
- Storage/security details
- Photos/appraisals
- Scheduled or blanket coverage preference

For umbrella:

- Underlying policies
- Liability limits
- Drivers
- Properties
- Watercraft
- Business exposure
- Prior claims

Step 3: Real Address Autocomplete

Property and garaging addresses must use a real address autocomplete provider, not fake suggestions. The provider should support real U.S. addresses and return normalized address data.

Suggested providers:

- Google Places API
- Smarty
- Mapbox

- Loqate

The address field must:

- Suggest real addresses as the user types
- Allow manual entry
- Normalize selected address
- Store formatted address, city, state, ZIP, latitude/longitude if available
- Open Google Maps links in a new tab where displayed

Step 4: Public Data Enrichment

After intake, the system attempts to enrich missing public information.

Examples:

- Property year built
- Square footage
- construction type
- flood zone
- roof data if available
- parcel data
- risk characteristics
- vehicle data from VIN
- prior known asset details already in client file

If data is not available, it should be marked missing, not invented.

Step 5: Missing Information Questionnaire

The system generates a customer questionnaire only for missing fields.

The questionnaire should:

- Be interactive
- Be accessible in customer portal/app
- Be shareable by link
- Be fillable by client, agent, CSR, or manager
- Save progress
- Show live shared-draft behavior where staff and customer can see updates
- Allow staff to fill manually
- Log sent/completed events in timeline

Step 6: Carrier Fit / Ranking

Once enough data exists, the system ranks eligible carriers.

Ranking must be based on real criteria, not random percentages.

Example ranking criteria:

- Carrier appetite for asset type
- Geography
- Coastal exposure
- Value range
- Claims history
- Prior carrier
- Desired coverage
- Underwriting restrictions
- Agency enabled carriers
- Carrier appetite notes
- Historical agency success
- Premium competitiveness if quote returned
- Coverage quality
- Financial strength if stored
- Service fit

Each carrier gets:

- Match percentage
- Color-coded badge
- Reason summary
- Appetite notes
- Strengths
- Concerns
- Missing requirements
- View on carrier button
- Email/contact info if relevant

Color coding:

- 90–100% excellent / green
- 75–89% strong / soft green
- 60–74% possible / gold
- 40–59% weak / orange
- Below 40% poor / red or hidden unless needed

Step 7: Quote Result Review

Carrier quote results should appear in a ranking area.

Each quote should show:

- Carrier
- Premium
- Deductibles
- Limits
- Coverage summary
- Exclusions/notes

- Effective date
- Quote expiration
- Required documents
- Underwriting concerns
- Match percentage
- View on carrier
- Send to client / present option

Step 8: Manual Policy Implementation

Do not claim the system directly implements policies unless a real carrier integration exists.

If no API exists:

- The agent manually binds/implements on carrier site
- Quotex can provide "View on carrier"
- Quotex can track "policy implemented manually"
- User can retrieve policy details afterward via AI runner/carrier retrieval
- Once confirmed, the policy is added to policies and billing

COMMERCIAL LINES FLOW

Commercial quoting must be ACORD/application based.

Step 1: Select Commercial Lines

When starting a quote flow, the first field is:

- Personal lines
- Commercial lines

If Commercial lines is selected, the system should explain that the flow is application-driven and may include one or more ACORD documents.

Step 2: Select ACORD / Application Templates

The agent, CSR, or manager selects one or more ACORD/application templates that apply.

Examples:

- ACORD 125 Commercial Insurance Application
- ACORD 126 Commercial General Liability
- ACORD 127 Business Auto
- ACORD 130 Workers Compensation
- ACORD 140 Property Section
- ACORD 146 Equipment Floater
- ACORD 160 Business Owners
- ACORD 175 Commercial Policy Change
- ACORD 25 Certificate of Liability
- ACORD 27 Evidence of Property

- ACORD 28 Evidence of Commercial Property
- Cyber application
- EPLI application
- D&O application
- Professional liability application
- Inland marine application
- Umbrella/excess application
- Crime application
- Garage/dealers application
- Restaurant/bar supplemental
- Contractor supplemental
- Habitational supplemental
- Lessor's risk supplemental
- Other carrier-specific supplemental

The system must allow more than one application/template to be selected.

Step 3: Public/Existing Data Fill

The system fills as much as it can from:

- Existing client profile
- Business name
- DBA
- FEIN if available
- Business address
- Mailing address
- Contact info
- Description of operations
- NAICS/SIC if available
- Prior policies
- Existing documents
- Website/public records
- Prior quote flows
- Uploaded forms
- Carrier library requirements

It must never invent uncertain data. If uncertain, mark it missing or needs confirmation.

Step 4: Missing Field Detection

After prefill, the system compares required ACORD/application fields against what is available.

It creates a missing-field list grouped by:

- Business info
- Locations
- Operations

- Payroll/revenue
- Vehicles
- Drivers
- Property
- Equipment
- Prior coverage
- Loss history
- Additional insureds
- Certificates
- Coverage limits
- Carrier-specific questions

Step 5: Commercial Questionnaire

The commercial questionnaire is generated from missing fields in the selected applications.

Important rule:

The core commercial questionnaire is filled out once and shared across carriers. The client should not answer the same basic commercial application questions separately for every carrier.

The commercial questionnaire should:

- Be one shared live draft
- Allow agent/CSR/manager manual completion
- Allow customer completion
- Save progress
- Show last edited by
- Show sent date if sent
- Include Send to Client button
- Include Fill Manually button
- Include Copy Link button
- Match the same format as supplemental questionnaires
- Log all sends/completions to timeline and remarks

Step 6: Application Review

Once questionnaire is complete, the system fills selected ACORD/application templates.

Before sending anywhere, the user should be able to:

- Preview each application
- Edit each field manually
- Save draft
- Mark ready for carrier submission

Step 7: Carrier Selection

The system shows a carrier selection popup/list.

Only carriers that meet all of these conditions should appear:

- Carrier handles commercial lines
- Carrier is enabled for the agency
- Carrier has an underwriter/contact email on file
- Carrier appetite is relevant enough for the submission

If no underwriter email exists, do not show that carrier as an option.

Carrier list should be ranked like a leaderboard by AI recommendation.

Each carrier row should show:

- Rank
- Carrier name
- Underwriter name
- Underwriter email
- Match percentage
- Appetite fit summary
- Why recommended
- Known concerns
- Select checkbox
- Select all option

Step 8: Email Draft Review Before Sending

Do not immediately send carrier submissions from the first button.

The action should be:

- "View email draft"

The draft should include:

- Personalized greeting to the underwriter
- Client/business name
- Line of business
- Short description of operations
- Desired effective date
- Summary of submission
- Attached applications
- Attached supporting documents
- Agent signature
- Agency branding/signature if configured

It should not sound AI-written. It should sound like a real agent personally sending an underwriting submission.

Example tone:

“Hi Priya, I hope you’re doing well. Please find attached the completed application and supporting information for Palm Coast Private Client’s insured below. Based on the operations and requested coverage, I thought this may be a good fit for your commercial appetite. Please let me know if you need anything else to review.”

User can edit:

- Subject
- Body
- Attachments
- Selected carriers
- Sender signature

Then they press:

- “Send to selected carriers”

Step 9: Sending to Carriers

When sent:

- Email goes to each selected carrier underwriter
- Each email appears in Messages under that carrier contact
- Quote flow status changes to Awaiting Carrier Response
- Timeline logs “Submission sent to selected carriers”
- Each carrier row shows waiting status
- No carrier should instantly become accepted/declined unless a real response exists

Step 10: Waiting Period

After carrier submission, the quote flow must clearly show:

- Sent date/time
- Carriers awaiting response
- Carriers responded
- Carriers declined
- Carriers requesting supplemental info
- Carriers accepted for quoting
- Follow-up due date if configured

Step 11: Carrier Email Response Parsing

The system should monitor connected email threads.

When an underwriter replies, the system analyzes the email and classifies it:

- Accepted / willing to quote
- Declined
- Needs supplemental
- Needs missing info
- Asked a question
- Sent quote

- Bound/issued information
- Unclear / needs human review

The system should never silently make risky assumptions. If uncertain, flag for staff review.

Step 12: Supplemental Handling

If a carrier requests supplemental information:

- Identify which carrier asked
- Identify what supplemental form or questions are needed
- Pull the carrier supplemental template on file if available
- Autofill what is already known
- Identify remaining missing fields
- Generate a supplemental questionnaire only for those missing fields

Supplemental questionnaire must use the same visual format as the commercial questionnaire.

It should include:

- Title: Supplemental Questionnaire
- Number of questions
- Section count
- Shared live draft badge
- Sent date if sent
- Copy link
- Send supplemental questionnaire
- Fill manually
- Explanation of what it is for

The button should not say “resend to client” because this is a new supplemental information request.

Step 13: Supplemental Email Draft Review

After supplemental answers are complete:

- System prepares supplemental package
- User clicks “View email draft”
- Draft is addressed only to the carrier(s) that requested it
- Attachments include completed supplemental docs and supporting files
- User can edit before sending
- Then sends

The sent supplemental must appear in Messages.

Step 14: Accepted Carrier Ranking

For commercial lines, rankings may appear in stages.

If some carriers accepted while others still need supplemental:

- Show rankings for accepted carriers only
- Clearly mark that ranking is partial
- Carriers waiting on supplemental remain pending
- When supplemental is completed and carrier accepts, add that carrier into ranking
- Declined carriers move to declined section

Ranking should never imply all carriers responded if they have not.

Step 15: Quote Presentation

Once quotes are received:

- Show carrier ranking
- Premium
- Coverage highlights
- Deductibles
- Conditions
- Subjectivities
- Required next steps
- Match percentage
- Recommended option
- Reasoning

Allow:

- Send quote options to client
- Download comparison
- Add note
- Mark selected
- View carrier email thread
- View on carrier

Step 16: Completion

When the client chooses an option and the agent binds it manually on the carrier site:

- User marks quote flow completed
- System can retrieve policy afterward if configured
- Policy is added to Policies
- Billing is added to Billing
- Documents are attached
- Timeline logs completion
- Quote flow moves to resolved/completed quote flows

INCOMPLETE CUSTOMER QUOTES

If a customer starts a quote and abandons it:

- Save as incomplete quote flow
- Show in Quote Flows

- Notify assigned staff
- Show exactly where they stopped
- Generate auto follow-up draft
- Provide Send to Client button
- Log in client/prospect timeline

Example:

“Sarah Johnson started an auto quote and stopped at Driver Information.”

EMAIL / MESSAGE REQUIREMENTS

Every carrier submission, supplemental send, client questionnaire send, quote presentation, and follow-up should be logged in Messages.

Email rules:

- Carrier/client/prospect/holder direct email sends from assigned employee's connected email
- AI marketing sends from agency main contact email
- Emails include real employee signature if configured
- No “AI generated this” language
- All sent emails appear in the relevant message thread

DOCUMENT REQUIREMENTS

Quote flows must connect to documents:

- Attach existing client documents
- Request missing documents
- Upload documents
- Preview documents before saving
- Fill ACORD/application fields
- Manually edit fields
- Publish finalized application documents
- Store sent application packets

TIMELINE REQUIREMENTS

Every quote-flow action must create structured timeline events.

Examples:

- Quote flow started
- Personal lines intake completed
- Commercial application selected: ACORD 125, ACORD 140
- Public data added to application
- Missing information questionnaire sent
- Questionnaire completed
- Carrier submission draft reviewed
- Submission sent to Chubb, PURE, The Hartford
- The Hartford requested supplemental information

- Supplemental questionnaire sent
- Supplemental package sent to The Hartford
- Chubb declined
- PURE accepted for quote
- Carrier ranking updated
- Quote options sent to client
- Quote flow completed

Do not expose backend/internal automation names to staff.

PERMISSIONS

Managers can:

- View all quote flows
- Assign/reassign
- Route/reroute
- Review carrier submissions
- Configure agency carrier contacts

Agents/CSRs can:

- Work assigned quote flows
- Start quote flows
- Send questionnaires
- Draft carrier emails
- Send submissions if authorized
- Complete quote flows

Customers can:

- Fill questionnaires
- Upload documents
- View quote presentation if sent
- Message agency
- Resume incomplete quotes

AUDIT / SAFETY

Important actions require confirmation:

- Sending carrier submission
- Sending supplemental package
- Sending quote presentation
- Completing quote flow
- Cancelling quote flow
- Moving quote to policy

Every action should be audit logged with:

- User

- Role
- Timestamp
- Client/prospect
- Quote flow ID
- Before/after state if relevant

WHAT NOT TO DO

- Do not call carrier APIs unless real APIs exist.
- Do not mention EZLynx or IVANS.
- Do not instantly mark carriers accepted after sending.
- Do not hide missing underwriter emails behind a broken option.
- Do not let carrier sends happen without email draft review.
- Do not mix quote flows into ordinary activities.
- Do not make the customer answer duplicate commercial questionnaires for every carrier.
- Do not invent public data.
- Do not expose “AI runner” language in client/staff-facing timeline.
- Do not leave buttons nonfunctional.

TESTING REQUIREMENTS

Test:

- Start personal quote flow
- Start commercial quote flow
- Select multiple ACORD documents
- Generate missing-info questionnaire
- Fill manually
- Send to client
- Complete questionnaire
- Select carriers with underwriter emails only
- View email draft
- Send to selected carriers
- Verify carrier messages receive sent email
- Simulate carrier accepted response
- Simulate carrier declined response
- Simulate supplemental request
- Send supplemental questionnaire
- Submit supplemental to carrier
- Ranking updates only for accepted carriers
- Complete quote flow
- Policy and billing records created
- Timeline and remarks updated
- Incomplete customer quote appears in Quote Flows

CARRIER AUTOMATION:

Current direction is AI runners, not carrier APIs. The runner securely uses stored agent credentials to access carrier portals, retrieve policy/renewal/billing/claim/document updates, and bring them into Quotex. Staff should not see "AI runner did this." Timeline should say natural things like "Carrier updated renewal document." The runner triggers after policy placement, before renewal, on manual retrieve policy/claim, and scheduled checks. All external links open in a new tab.

MESSAGES:

Remove SMS everywhere. Email only. Agent/CSR/manager emails connect to their real email account. Direct messages to clients, prospects, holders, and carriers send from assigned employee email. AI marketing campaigns send from agency main contact email. Messages must mirror inbound and outbound email threads. Open in Gmail/Outlook/etc. should open relevant thread when possible. Carrier messages show contact position and carrier name.

AI PORTAL ASSISTANT:

The assistant must know the whole product. If asked how to do something, explain and link training video section. If asked to do something, ask confirmation, then perform the action. It must create reminders, company reminders, calendar events, route/reroute, draft/send emails, update records, open links, create activities, summarize clients, pull policy info, and log actions correctly. Actions must be validated, confirmed, and reflected in the right timelines/reminders/calendars.

CALENDAR:

Google-calendar-like weekly default. Shows reminders, company reminders, activity due dates, meetings, personal events, and company events. Company reminders appear on all recipient calendars. Add request-internal-meeting flow with recipient notifications and accept/reschedule. Completed events are struck through, not deleted.

CLAIMS:

Claims card matches policies/billing style. Include Previous Loss Runs, Retrieve Claim, Add Claim. Closed claims move to previous loss runs. Loss runs can be sent to client, holder, carrier, and downloaded as professional PDF. Add loss history manually or by AI upload.

BILLING:

Billing is informational only, not payment collection. One row per policy. Billing detail page shows premium, payment plan, how paid, billing path, carrier billing info, next due, amount due, billing history, premium increase percent, and send billing summary to client.

MARKETING:

AI marketing generates branded digital pamphlets using agency name, logo, contact info, website/app link. Remove separate pamphlet branding card if branding comes from Agency Setup. Campaigns sent to Alexandra or any client must show in that client's marketing campaigns received. Get in touch button must be obvious and functional, opening website or app based on device.

AGENCY SETUP:

Rename Agency Settings to Agency Setup with fitting icon. Include agency logo upload with auto-resize, agency name, branches/locations, main contact email, website/app configuration, user management, plan visibility for managers only, and read-only view for agents/CSRs.

Deleted/banned users do not reduce paid capacity.

ACCOUNTING / HR / ANALYTICS:

Accounting includes timesheets, timesheet configuration, carrier production totals, percentage by carrier, individual agent production, and manager review. HR allows anonymous or named complaints and suggestions, visible to managers. Agent analytics shows personal performance and company goals, with ability to request goals. Manager receives goal request notification, not activity.

TRAINING:

Training videos are uploaded/managed by System portal. Agent/CSR and manager training differ. Videos are real hosted assets, not fake embedded code. Support subtitles, speed, open in new tab, completion tracking, and links to exact sections.

CUSTOMER PORTAL / APP:

Quotex app is universal; customers select/sign into their agency, not separate apps per agency. Agency websites remain separate. Customer app must fit phone screens, no cramped sidebars, no overlapping documents. Include quote, policies, docs, claims, billing, profile, contact agency, call agent, message agency. Contact page has personal agent and agency contact sections with phone/email/address hyperlinks.

SECURITY:

Production must use tenant isolation, row-level security, secure auth, backend-only secrets, audit logs, file access controls, signed URLs, credential vault, encrypted agency codes, role permissions, and safe runner controls. Do not expose secrets in browser. Do not rely on frontend-only permissions.

TESTING / ACCEPTANCE:

Run TypeScript, unit tests, production build, and browser tests. Verify all main routes load, buttons respond, no stuck loading screens, no text overlaps, no cutoffs on laptop and monitor sizes, external links open new tabs, email/demo actions log correctly, and demo mode works without production credentials. Document any production dependency that requires real API keys, email OAuth, Stripe, Supabase, or credential-vault setup.

Deliver this as a serious production SaaS foundation with polished demo mode, not a fragile prototype.
